Abstract
Economic, physical, built, cultural, learning, social and service environments have a profound effect on lifelong health. However, policy thinking about health research is dominated by the ‘biomedical model’ which promotes medicalisation and an emphasis on diagnosis and treatment at the expense of prevention. Prevention research has tended to focus on ‘downstream’ interventions that rely on individual behaviour change, frequently increasing inequalities. Preventive strategies often focus on isolated leverage points and are scattered across different settings. This paper describes a major new prevention research programme that aims to create City Collaboratory testbeds to support the identification, implementation and evaluation of upstream interventions within a whole system city setting. Prevention of physical and mental ill-health will come from the cumulative effect of multiple system-wide interventions. Rather than scatter these interventions across many settings and evaluate single outcomes, we will test their collective impact across multiple outcomes with the goal of achieving a tipping point for better health. Our focus is on early life (ActEarly) in recognition of childhood and adolescence being such critical periods for influencing lifelong health and wellbeing.

First published: 14 Oct 2019, 4:156 https://doi.org/10.12688/wellcomeopenres.15443.1
Background
Areas with high levels of child poverty tend to have increased rates of obesity, polluted roads with low walkability, poor quality green spaces for play and exercise, high fast food outlet density and food poverty; poorer levels of child development, school readiness and educational attainment, higher school exclusion rates, poor performing schools and lower entry into further education; unsafe neighbourhoods, higher levels of youth crime, physical decay, poor public services and poor quality, overcrowded unfit, temporary/rented and unaffordable housing. Children growing up in these areas are more exposed to stress, chaos, violence and household instability. These wider determinants and inequalities in these, damage child health and cause an accumulation of multiple environmental risks and clustering of unhealthy behaviours, that impair life opportunities and increase longer term non-communicable disease (NCD) risk. Addressing them can improve health outcomes, but too often NCDs have been attributed to bad choices rather than framed as emergent properties of complex systems. Public health interventions seek to directly influence behaviours rather than addressing the conditions that drive them and directly and indirectly affect health. There is robust research on how upstream factors affect NCD risk but little around how to address these at a local level where action is needed. There is also poor linkage between academics, those with broader interdisciplinary expertise, and the statutory, voluntary, cultural and commercial sectors, despite them all having a role in improving public health.

There is increasing focus on how to reduce inequalities in wider determinants, shifting the emphasis from deficits to harnessing of community assets, recognising the lived experiences and resourcefulness of disadvantaged communities, working ‘with’ rather than delivering ‘to’ people, and applying systems thinking principles to examine poor and unequal health “as outcomes of a multitude of inter-dependent elements within a connected whole”[2,6]. Components of factors influencing health, interact in complex and dynamic ways. A complex systems approach requires bringing together all stakeholders from across the system to understand how, when and where to intervene. This means taking account of the key concepts of complex adaptive systems - emergence, feedback loops and adaptation, and using systems-focused interventions which may be partner-led, natural experiments or simulation studies that make use of data whilst also identifying what information is needed to support replicability. It also means using more credible methods of economic evaluation to inform social policy decisions, based on careful modelling of interacting social, fiscal and health outcomes and accounting for budget constraints and opportunity costs for different social groups. Across Europe, there are just a few examples of systems initiatives that have achieved reductions in child obesity prevalence and inequalities[10,11], or that have delivered city-wide system change in ecology, technology, mobility and urban design to improve equity in the social determinants of health[12]. UK transdisciplinary research is now needed that can change broader environments to improve the lives of our most vulnerable communities, focusing on children to yield high returns across the entire lifecourse.

In 2017, the UK Prevention Research Partnership (UKPRP), launched a novel model of public health funding to support research into the primary prevention of NCDs that could develop innovative and interdisciplinary approaches, and deliver upstream interventions to improve population health and reduce unfair health inequalities. We have been awarded a 5-year UKPRP consortium funding to develop ActEarly City Collaboratories. “Cities are an ‘immense laboratory of trial and error, failure and success”[13] and our city approach will provide real world opportunities to scope, deliver and evaluate sustainable and replicable population prevention interventions.

Aims and objectives
Our long-term vision is to promote a healthier, fairer future for children living in deprived areas through a focus on improving environments that influence health and life chances.

Our objectives are:
1) To establish a prevention research consortium that unites broad transdisciplinary expertise including economics, geography, urban design, transport, education, housing, arts and culture, social justice and welfare (alongside the more usual public health sciences), with the public, policy leaders and practitioners from across our populations to develop shared understanding and priorities.
2) To identify, co-produce and implement system-wide early life upstream prevention solutions.
3) To provide efficient data platforms and methodological expertise enabling robust population-scale evaluation of the impact of interventions on environments, health related behaviours and interlinked health, educational, social and economic outcomes.
4) To evaluate, refine, replicate and disseminate our City Collaboratory approach as a model for addressing upstream determinants of health and inequality.

Development of City Collaboratories
City Collaboratories in areas of high child poverty will provide research-ready, people-powered and data-linked test beds to co-produce, adapt and evaluate multiple novel early life interventions to prevent disease and reduce inequalities. Our City Collaboratory approach will provide a whole-system environment where the public, scientists, policy leaders and practitioners work with each other to develop and test system-wide early life upstream prevention solutions, supported by efficient platforms for robust evaluation. We will create City Collaboratories first in Bradford (a post-industrial city in the North of England), and then in Tower Hamlets (a London borough) to support the identification, implementation and evaluation of upstream interventions in areas with high levels of child poverty. Our initial focus will be in Bradford, which provides a research-ready population laboratory for prevention research due to: its level of need, research track record, strong data linkage, pipeline of interventions and deep engagement with the community and local policymakers. Bradford, the fifth-largest city in the UK, has high levels of poverty and ill-health. It is ethnically diverse, with a large South Asian community...
and an accelerating prevalence of diabetes and cardiovascular disease\textsuperscript{14}. Researchers working with policymakers have built strong networks across health care providers and schools, connecting multiple systems and developing whole-system information and analytic capacity. We have worked closely with our communities to promote a strong public voice in the focus and delivery of research and now have a population based, system wide research infrastructure with committed investment to support the delivery of interdisciplinary preventative interventions.

Tower Hamlets, the London ActEarly Collaboratory site, will help explore replicability of the model and generalisability of interventions. Similar to Bradford, this East London borough is ethnically diverse and has some of the highest rates of child poverty in the UK, but it also has a strong foundation of community-developed research, in particular through the Communities Driving Change programme and transformative community health models developed by the Bromley-by-Bow Centre. The local authority has demonstrated enthusiasm and commitment for ActEarly and offers an existing platform of linked routine data through the Whole Systems Data Integration programme.

The Collaboratory model consists of a multistep interactive cycle that places local communities at the heart of decision making and active participation in both shaping and using the research, and connects academic expertise with real-world policymakers (see Figure 1). This cycle consists of: a) raising ideas (informed by evidence synthesis of epidemiological and other sciences), b) moving them through a critical cycle of engagement with stakeholders and by using Citizen Sciences\textsuperscript{15}, c) co-producing prioritised intervention strategies using internal and external experts, d) implementation (using whatever method is deemed optimal) and e) evaluating impact. Our evaluation will explore process (of the Collaboratory model itself and of interventions) and outcome (health and wellbeing, inequality outcomes, associated costs).

We will apply our ActEarly Collaboratory model to work programmes of three inter-linked themes that were identified collectively during the development phase of our programme: Healthy Places, Healthy Learning and Healthy Livelihoods (Figure 1). These themes are underpinned by an emphasis on co-production and informed by our logic model (see below).

**Co-production of evidence with users**

We are committed to genuine co-production with users in order to achieve acceptable, feasible, replicable, and sustainable systems interventions with real impact. We will engage policymakers, third sector organisations and our public (especially young people and their families) using citizen science methods of community engagement and prioritization in an asset-based community development approach\textsuperscript{16} to sustainable community-driven change, building on work already started. Evidence shows that interventions engaging community members in delivery are effective, but no particular model of engagement appears superior\textsuperscript{17}, so we will test multiple approaches to support co-production ranging from robust consultation and dialogue, to complete multidisciplinary community and stakeholder led co-production.

We have started our co-production activities, developing, refining and prioritizing the suite of activities outlined in each work

\begin{figure}
\centering
\includegraphics[width=\textwidth]{Diagram1.png}
\caption{The City Collaboratory model utilises wide interdisciplinary expertise based in three inter-linked themes: Healthy Places, Healthy Learning and Healthy Livelihoods.}
\end{figure}
programme with all key user groups. We have already identified synergies between community needs, policy and decision maker, and other user group priorities across our programmes and sites, for example: safer streets (places), healthy vending options in school (learning), easier access to welfare advice (livelihoods). Within each theme, we will start by eliciting user insights and experiences around prioritised topics using a tool kit of citizen science approaches (e.g. participatory mapping, extreme citizen science) and traditional methods for consultation, dialogue and priority setting (e.g. open space). We will then refine and adapt existing co-production methods (e.g. experience-based co-design) to unite communities, policymakers and researchers in focused co-production groups. We will evaluate the impact and effectiveness of our co-production activities on processes, outputs and impacts using mixed qualitative and quantitative methods. This will help develop and deliver appropriate engagement models across our sites and inform implementation of co-production activities within ActEarly.

**Logic model**

ActEarly’s logic model (Figure 2) builds on a supportive system context (model base, green) of high need for ActEarly in both areas and capacity to intervene, which is particularly advanced in Bradford. Our key inputs include ActEarly’s wide multidisciplinary research team and strong partner support; its defining strengths, citizen science/co-production and rich data infrastructure, will be further enhanced. Our key outputs will be knowledge and evidence. Capacity building for current and potential researchers supports all ActEarly activities by promoting researcher skills, career entry and progression and leveraging further funding to support more evaluation (yellow arrow). Outcomes of novel methods in turn will increase the scale and scope of evaluation (yellow arrow). Promoting awareness of our outputs will enable ActEarly to influence decision making. Decision makers’ responses will also influence intervention development & evaluations (yellow arrow). The underpinning data infrastructures enables examination of longer-term impacts.

**ActEarly themes**

**Healthy places**

The spaces we live in affect how we travel, exercise, eat, socialise and interact. Deprived areas are often unhealthy obesogenic environments for children and young people, with physical infrastructure that increases barriers to healthy living such as physical activity (busy roads, lack of street connectivity, poor-quality green spaces), and healthy eating (fast food outlets). These are compounded by factors such as fear of crime and hostile traffic, lack of well-connected routes to work and leisure activities, low levels of social cohesion and unfit and overcrowded housing. Research shows links between poorly designed neighbourhoods and obesity, mental health and cardiovascular health, as well as poor social connectedness with community assets (arts, culture, parks, libraries, leisure centres, volunteer associations, social and community groups). Social networks and social capital are weakest in the most deprived areas. Thus, modifying local ‘places’ to make it easier for disadvantaged families to live better lives may offer gains across a range of outcomes.

We aim to increase the health and social potential of local places for children and young people by both changing physical infrastructure and by promoting connected communities. Improvements to physical environment will be based on the ‘healthy streets’ approach, which outlines indicators to promote healthy places: Everyone feels welcome, People to choose to walk

![Figure 2. ActEarly logic model.](image-url)
and cycle, People feel relaxed, Easy to cross, Clean air, Not too noisy, Places to stop and rest, People feel safe, Things to see and do. Better connections within and across communities will be developed through locally led interventions including Bradford Metropolitan District Council’s (BMDC’s) Living Well programme which includes a healthy charter for businesses and communities, and a Tower Hamlets-based Community Engagement Campaign programme to encourage use of social, cultural and community assets. We will also evaluate natural experiments, for example Bradford’s Clean Air Zone, which is due to be implemented in 2020. All these interventions should impact on key lifelong health outcomes including prevalence of obesity, mental wellbeing and social outcomes, such as opportunity and social mobility. In the short term, we expect impact at an individual level (increased physical activity, active school travel; reduced exposure to emissions, improved eating behaviours), at the community level (increased use of open spaces; better social connectedness and more community participation) and at an environmental level (community assets and social infrastructure e.g. more safe play areas, better air quality, improved food environment). From a systems perspective, changing the attributes of place will change how communities move and thrive in that place thus creating interconnections between the ActEarly themes and delivering change across the whole system.

Some examples of our Healthy Places research questions include the following: Can ActEarly Healthy Places interventions:

1) Reduce child obesity and improve child mental wellbeing?
2) Increase active travel?
3) Increase the use and quality of open spaces for play and recreation?
4) Increase social connectedness?
5) Improve air quality?
6) Reduce health inequalities?
7) Increase uptake of housing related services (rights, advice, improvements, repairs) and maximise benefits of new housing?

Healthy Learning

Literacy and educational status are major upstream determinants of health, but educational opportunities are often poor for those living in disadvantaged areas\(^{35}\), maintaining inter-generational cycles of inequality\(^{36}\). Learning environments can play a critical role in encouraging children to adopt healthy lifestyles and nurturing the social and emotional wellbeing critical to good health\(^{34}\). Learning is linked to place, and can provide powerful settings for community interactions which can support good parenting (e.g. parental engagement networks), and opportunities for wider health and social care (e.g. access to services and welfare advice). Previous attempts to introduce health programmes to schools (e.g. Social and Emotional Aspects of Learning (SEAL), the National Healthy Schools programme) have often produced minimal change\(^{32}\). A new approach is needed that can move beyond a collection of individual health-promoting activities and deliver a real step change. Bradford is a UK Department for Education Opportunity Area with a delivery plan to improve opportunities for children and young people in the city. Via this initiative, we have established an ‘evidence active network’ (EAN) involving all learning environments across Bradford. The EAN will enable schools (n = 206) and pre-schools to adopt evidence-based practice in teaching and learning and empower staff and children to participate in research as citizen scientists. ActEarly offers an opportunity to widen the EAN’s remit to include health and wellbeing, and develop and deliver large scale evaluations - first in Bradford, with later extension and evaluation in Tower Hamlets. We will work with Evidence Champions on schools’ senior management boards to co-produce, deliver and evaluate health initiatives within local trailblazing sites, share learning across the network and develop an intervention ‘menu’. We will engage staff and students to create profiles of their environments as a baseline for monitoring progress against key indicators, such as absenteeism, attainment, child and adolescent mental health (CAMHS) referrals, exclusion, primary and secondary healthcare episodes.

Some examples of our Healthy Learning research questions include the following:

1) Does the EAN increase uptake of evidence-based interventions within early years and school settings?
2) Does the EAN increase participation of children, families, teachers, professionals and the community in research?
3) Which interventions have the greatest impact on physical and mental health, social wellbeing and educational attainment?

Healthy livelihoods

People’s livelihoods are important for both their mental and physical health, partly due to higher levels of education, income and social class providing material benefits for health at all ages, but also through psychosocial mechanisms – dignity, sense (and locus) of control and self-worth, engagement in meaningful activity, social networks/social capital, social status\(^{38}\). Demands are higher and resources lower at two critical stages: during the transition to parenthood and in early childhood\(^{37}\), and during young people’s transitions from school into adulthood\(^{38}\). Our aim is to develop and evaluate interventions and initiatives to address child, young person and family wellbeing and opportunities through increasing income, skills and control over community resources. The interventions will be co-produced with communities and include promoting take up of existing policy measures (2-year-old early education offer, co-locating welfare benefits in maternity services), pioneering interventions (universal basic income (UBI) and skills) and scaling-up promising interventions in new contexts (participatory budgeting). Outcomes we anticipate being affected in the short term are both child/adolescent/young adult/family-centred
and place-based: i) child (social skills and cognitive abilities age 3; participation and enjoyment, school readiness); ii) young person (employment, training, education, participation, social and cultural capital, mental health and wellbeing); iii) family (maternal employment, family stress, paternal involvement, maternal health and wellbeing); iv) community (cohesion, neighbourliness), all of which affect the risk of NCDs.

Some examples of our Healthy Livelihoods research questions include the following:

1) What are some of the obstacles to the uptake of early childhood education and care, what interventions might increase appropriate uptake and what is their effect on key outcomes?

2) Can a UBI for young adults improve self-efficacy, mental health & wellbeing and engagement with education, employment, training and entrepreneurship? Is this more or less or cost-effective or effective when combined with life skills training?

3) Does community involvement (e.g. in participatory budgeting, a poverty commission or a social inclusion currency) improve individual self-efficacy, social support and health, and community wellbeing?

Examples of early interventions identified in our three themes are described in Table 1. We will develop logic models or causal loop diagrams for the design of interventions and their evaluation, and will promote strong cross-theme collaboration, for example where interventions across themes share common aims, populations or outcomes.

Evaluation framework

Complex systems theory and complexity thinking provide the framework for our analysis of systems focusing on the relational nature of systems, and the resulting emergent properties of those relations. ActEarly aims to evaluate the impacts of interventions in a complex system setting on the health of children in Bradford and Tower Hamlets across the three themes. We will collect and link bespoke and available data at individual and area-level to enable evaluation of multiple initiatives.

Outcomes

For all interventions, combinations of interventions, and systems we will be interested in (a) understanding processes of implementation including adaptation, (b) effectiveness and (c) economic impact. We will estimate both average and distributional effects, harnessing our consented cohort and routine linked datasets to follow up our children’s longer-term health and wellbeing outcomes.

Single intervention evaluations

We will use a variety of methods (see Table 2), depending on context, with a preference for quasi-experimental methods (e.g. propensity score matching, regression discontinuity designs, difference-in-differences) where possible. Qualitative data collection will give insights into how interventions achieved (or not) their effects, paying particular attention to contextual factors, and to identify any unexpected impacts.

Evaluating combinations of interventions

We will treat ‘groups of conditions’, (combinations of interventions that may interact to produce effects through ‘conjunctural causation’) as cases and use qualitative comparative analysis (QCA)\(^99\) as our approach. This algebraic technique will be used to test the extent to which different components of the configuration of the interventions, and their context, seem necessary or sufficient to produce outcomes. It will allow us to examine pathways to both positive and negative (unintended) outcomes across our complex system. Definition of cases can be based on both quantitative and qualitative data, the configurations of which are analysed as either ‘crisp set’ (where data are clearly binary) or ‘fuzzy set’ (allowing for calibration to a scale where they are not).

Whole, complex system analyses

We will co-develop complex systems maps\(^40\), and/or complex networks of systems, related to each of our research themes or related to producing outcomes in, for example, early childhood, school age children or young adults, or systems related to particular stakeholder spheres of influence, e.g., local authorities. Systems will be developed and described through iterative concept mapping, expert input (via Delphi surveys) and then simulated (and refined) via agent-based and/or system dynamic models. Empirical data will then be used to explore the credibility of, and to improve, the system models.

Life course analysis, policy and economic modelling

We will simulate long-term policy effects, public costs and inequality impacts of interventions, sets of interventions or systems for our Collaboratory sites and nationally, building on microsimulation methods\(^45\). Simulation methods will explore long-term impact of interventions on health using relationships between early life predictors and later disease.

Meta-evaluation of the ActEarly Collaboratory

We will adopt a realist context-mechanism-outcome perspective. This will involve multiple components including QCA, a complex systems analysis of the whole Collaboratory, social network analysis of collaborators, qualitative interviews, and tracking of processes, outputs and impact on policymaking.

Data tapestry

Our evaluation plans will require efficient use of our bespoke and routine data sources. We benefit from well-established data platforms in both Bradford and Tower Hamlets. Bradford has some of the most richly described populations in the UK with its cohorts and Connected Bradford dataset which includes linked health, social care and education routine data for 700,000 citizens. Tower Hamlets is establishing a parallel Whole System Demonstrator-linked dataset, and both settings

be the building of trusted and enduring partnerships between researchers, practitioners and policymakers, promoting effective dissemination and communication developed from the best implementation science and drawing on professional communications and marketing expertise (see communication plan). ActEarly will favour an integrated approach that incorporates direct audience engagement with information push, pull, linkage and exchange. The development of specific knowledge mobilisation activities for the consortium’s proposed research outputs will be theory driven and informed by the topic, research findings, and the needs and preferences of the audiences to be targeted. Our goal is to produce evidence that is useful to decision makers.

Challenges
This is an ambitious research programme that aims to catalyse system-wide transformation underpinned by strong co-production and robust evaluation of multiple and interacting health promoting interventions across two city regions. We face a number of challenges in implementing such a programme. Effective community engagement will be central to the prioritisation and uptake of interventions. Key to this success is being sensitive to the complexity of the setting and understanding the need to reconcile differing agendas. We will use multi-faceted approaches that capitalise on traditional strengths and assets but also develops novel methods of citizen science and participatory research.

We will need to embed our research within mainstream policy and practice and work hard to achieve and maintain meaningful engagement between communities, researchers, local authorities and local and national stakeholders in an era of severely constrained resources. We will be required to prioritise our activities to maximise value of limited resources and attract funding to support an ambitious pipeline of interventions. The curation and development of multiple combined data sources will need to be safe and secure but also accessible and more useful for prevention policy than the conventional randomised trial approach to causal inference. We also face methodological challenges in evaluating multiple and interacting population level interventions and natural experiments. Our meta-evaluation will capture and monitor our progress in tackling these challenges.

Data availability
No data are associated with this article.

Acknowledgements
ActEarly is only possible because of the enthusiasm and commitment of our local and national partners and our communities in Bradford and Tower Hamlets. We are grateful to everyone who has made our ActEarly City Collaboratory happen.

This Open Letter is an important take on a challenging area for chronic disease prevention - namely the ‘how’ of putting prevention research into practice, instead of simply describing the ‘what’ (the problem of chronic disease). This paper sets out an impressive program of work and research which is ambitious and comprehensive. The researchers should be commended for this and for engaging with systems thinking in an applied way.

The background, aims and objectives are clearly described, as are the major themes for the project. The challenge for this paper was in outlining and explaining the overall elements of the project with sufficient detail in a way that does not feel like there are lots of bits and pieces. This is where Table 1 on page 9 with intervention examples is particularly helpful, and the data tapestry (Figure 3) is a useful way of identifying all the different data components of the project. However, the evaluation components are included in a separate table, which does make it a little difficult to link the evaluation framework with the broader project.

The authors have developed a logic model to support the program, which is understandable given others such as Foster-Fishman and Watson have argued a logic model (or a ‘theory of change’) is an essential part of a systems approach. However it was less clear how this rather linear logic model fit within the authors’ definition of a ‘supportive system context’ in terms of the program.

The authors briefly explain in the ‘Evaluation framework’ section why complex systems theory and complexity thinking are being used, but it is worthwhile to reflect on complex systems approaches to evaluation, which consider feasibility and appropriateness of complex program evaluations within real world settings. The researchers have demonstrated how complex systems thinking is informing the
intervention but less so for the evaluation framework. This would address the point raised earlier about clearly linking the different evaluation components with the intervention components.

In the section on co-production, it is necessary to define co-production beyond describing the importance of engaging and empowering citizens through citizen science or participatory action research. For example, given this is an initiative bringing together researchers and policymakers, it is helpful to reflect on why co-production between these two groups is needed, particularly in terms of prevention, or what the existing evidence base is for co-production for prevention\(^3,4\) and how this impressive program of work and evaluation will add to it.

The open letter describes a large and ambitious consortium research project commissioned under the UK Prevention Research Programme. In a similar vein to trial pre-registrations, this letter sets out to pre-register the team's plans to set up two City Collaboratories focused for whole-systems research on influences in childhood and adolescence that shape health outcomes over the lifecourse.

This is clearly a very well thought out project, and it has prevailed through several stages of rigorous selection and peer review, so there is not really anything left for me to critique in terms of scientific quality. The authors present a strong, multi-pronged evaluation framework that allows them to reflect on whether ActEarly is achieving its milestones.
